

$U(I)$ [V]

$$R = a - A$$

$$U(I) = R \cdot I + U_0$$

$$\text{für } U(I = 56 \text{ mA}) = 4.29 \text{ V}$$

$$\Rightarrow 4.29 \text{ V} = -1.574 \Omega \cdot 56 \text{ mA} + c$$

$$\Rightarrow c = 4.375 \text{ V}$$

$$\text{für } a = R \cdot F: U_{-F} (I = 73 \text{ mA}) = -1.523 \Omega \cdot 73 \text{ mA} + c = 4.19 \text{ V}$$

$$\Rightarrow c_F = 4.387 \text{ V}$$

$$\Rightarrow \Delta c = c - c_F = 0.007 \text{ V}$$

$$\text{Ausgleich } a - A = \frac{4.83 - 4.777}{30 - 73} \text{ mA} = -7.574 \frac{\text{V}}{\text{A}}$$

$$\text{Fehler } a_F = \frac{4.32 - 4.19 \text{ V}}{40 - 73 \text{ mA}} = 2.523 \frac{\text{V}}{\text{A}}$$
